

Ideation Phase

Brainstorm & Idea Prioritization

Date	3 September 2026
Team ID	Individual Project
Student Name	Morla Jahnavi
Project Name	An Employee Requests Installation of Licensed Software through the Service Catalog
Maximum Marks	4 Marks

Project Overview

The **Licensed Software Request Automation** project aims to simplify and automate the process of requesting and installing licensed software in an organization using **ServiceNow**. Employees can submit their software requirements through a centralized Service Catalog instead of relying on emails or manual communication. Once a request is submitted, the system can automatically handle notifications, approval, and fulfillment activities. This helps reduce manual work, improves request tracking, ensures proper authorization, and supports software licensing and IT governance requirements.

Brainstorm & Idea Prioritization:

The ideation process focuses on understanding the difficulties in the existing software request procedure, identifying possible automation methods, organizing the proposed ideas, and selecting a practical solution that can be implemented using ServiceNow.

Step-1: Team Gathering, Collaboration and Select the Problem Statement

- Project Type: Individual Project
- Stakeholders considered: Employee/Requester, Approver, IT Support/Fulfillment Team, and IT Governance.
- Selected Problem Statement:

Employees require a convenient and structured method for requesting licensed software. When requests are handled manually through emails or informal communication, important information may be missed, approvals may be delayed, and users may have limited visibility into the progress of their requests.

Business Objective:

- Create a standardized process for submitting software installation requests.
- Reduce manual communication between employees and IT teams.
- Automate the approval process for software requests.
- Automatically assign installation tasks to the appropriate support team.
- Provide employees with visibility into their request status.
- Maintain proper request information for licensing and governance purposes.
- Improve the overall efficiency of software request fulfillment.

Step-2: Brainstorm, Idea Listing and Grouping

Brainstormed Ideas:

- **Develop a Service Catalog item:** Create a dedicated catalog form through which employees can submit software installation requests.
- **Collect essential information:** Include fields such as software name, required version, reason for installation, and urgency.
- **Automate the approval process:** Configure Flow Designer to automatically route requests for approval before the installation task is created.
- **Generate fulfillment tasks:** Create a Catalog Task automatically and assign it to the responsible IT or Software Support team.
- **Provide request notifications:** Send an automated notification to the employee after the request is submitted.
- **Enable request tracking:** Allow users and support teams to monitor the request through ServiceNow records such as Request, RITM, and Catalog Task.
- **Support licensing compliance:** Capture software justification and version information so that the organization can maintain appropriate governance over licensed software.

Idea Grouping:

- **Request Management** – Service Catalog form and request variables.
- **Workflow Automation** – Notifications, approvals, and automatic task generation.
- **Request Fulfillment** – Assignment of software installation tasks to the appropriate IT support team.
- **Tracking and Compliance** – Request visibility, software justification, and standardized processing.

Step-3: Idea Prioritization

The proposed ideas were evaluated according to their business importance, implementation feasibility in ServiceNow, ease of development, and ability to reduce manual effort.

Idea	Business Value	Feasibility	Priority
Service Catalog request form	High	High	High
Automated approval workflow	High	High	High
Automatic Catalog Task creation	High	High	High
Email notification	Medium	High	High
Request status tracking	High	High	High
Advanced licensing integration	High	Medium	Future Enhancement

Selected Solution:

The selected solution is a ServiceNow-based automated software installation request system. Employees submit their licensed software requirements through a Service Catalog form. After submission, ServiceNow generates the necessary request records and the configured Flow Designer process sends a confirmation notification, initiates the approval process, and creates a Catalog Task for the IT or Software Support team once the request reaches the fulfillment stage.

Implemented Project Flow

1. The employee accesses the Software Installation Request available in the Service Catalog.
2. The employee enters the required information, including Software Name, Version, License Justification, and Urgency.
3. After submission, ServiceNow generates the corresponding Request and Requested Item (RITM) records.
4. The configured Flow Designer sends an automated confirmation notification to the requester.
5. The submitted request is then forwarded through the configured approval process.
6. Once the request proceeds to fulfillment, a Catalog Task is generated and assigned to the Software Support / IT Support team.
7. The requester and support team can monitor the progress using the centralized ServiceNow records.

Skills Required

- ServiceNow Service Catalog
- Flow Designer
- Business Rules
- Table and Record Management
- Workflow Automation
- Email Notifications

Software Requirements

- ServiceNow Instance — Personal Developer Instance or Enterprise Instance
- Flow Designer
- Service Catalog
- Email Notification support
- Email Script support

Hardware Requirements

- Desktop or laptop computer
- Minimum 4 GB RAM
- 8 GB RAM recommended
- Stable internet connection

Expected Outcome

The proposed system provides an organized and automated approach for handling licensed software installation requests. It minimizes manual coordination between employees and IT teams, provides better visibility into approval and fulfillment activities, and maintains a centralized record of each request. The automation also helps establish a consistent approval and fulfillment process while supporting software licensing and organizational governance requirements.
